The Revolution of Cancer Immunotherapy

How does our immune system sense and eliminate tumors?

How do immune checkpoint inhibitors work?

CHECKPOINT INHIBITOR DRUGS

"CHECKPOINT" PROTEINS BLOCK T-CELL ACTIVITY.
INHIBITOR DRUGS CAN RELEASE THE BRAKES ON T CELLS AT DIFFERENT STAGES.

THE CTLA-4 CHECKPOINT PROTEIN PREVENTS DENDRITIC CELLS FROM PRIMING T CELLS TO RECOGNIZE TUMORS. INHIBITOR DRUGS BLOCK THE CHECKPOINT.

THE PD-1 CHECKPOINT PROTEIN PREVENTS T CELLS FROM ATTACKING CANCER CELLS. THE INHIBITOR DRUG ALLOWS T CELLS TO ACT.

How do immune checkpoint inhibitors work?

Deciphering the sugar code: **Glyco-checkpoints** in immunity

Colored electron micrograph of the glycan layer (blue), glycocalyx, on surface human cell

Key paradigms of glycans in human health and disease:

- ▶ All cells in nature (e.g. human & bacterial) have a dense outer coat of glycans
- ▶ Glycans dominate the interface between us (our mucosa) and them (microbiota)
- ▶ Glycans play key roles in (human & microbe) cell-cell communication & regulation
- ▶ The large complexity encoded in glycan structure is non-template driven
- ▶ Every disease that affects humans significantly involves (altered) glycans

Deciphering the Sugar Codes: Glycocheckpoints in Immunity

GLYCAN-BINDING PROTEINS OR LECTINS:

1. SIGLECS
2. C-TYPE LECTINS
3. GALECTINS

Rabinovich et al, Immunity 2012, Mendez Huergo et al, Curr Opin Immunol 2017

Galectins

a Prototype

GAL1, 2, 5, 7, 10, 11, 13, 14, 15

- Galectins are a family of soluble glycan-binding proteins that preferentially recognize N-acetyl-lactosamine (Gal β 1-4GlcNAc) units on different cell surface receptors

- They establish multivalent interactions with glycosylated receptors and control immune cell fate (activation, differentiation and survival).

b Chimera-type

GAL3

c Tandem repeat-type

GAL4, 6, 8, 9, 12

An unexpected finding: Galectin-1 (Gal-1): an inhibitory sugar-binding protein in the immune system

Identification of a 14.5 kDa β -galactoside-binding protein in activated macrophages

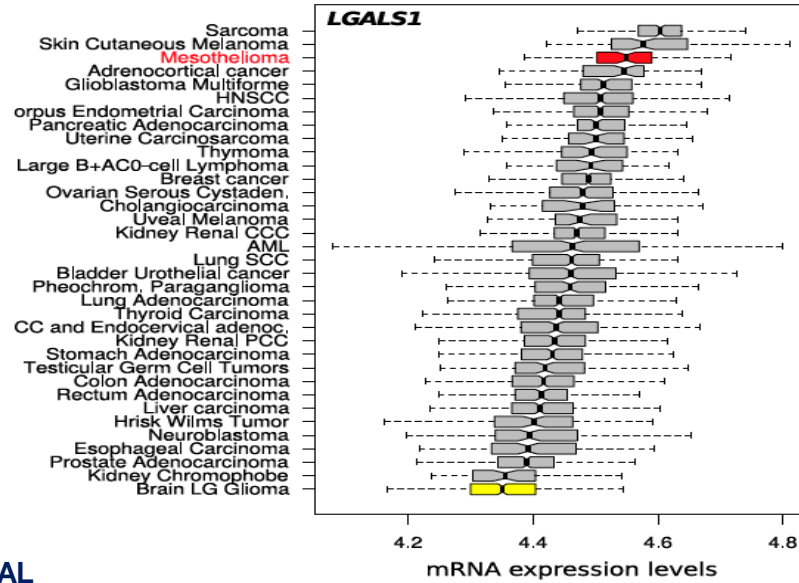

Rabinovich et al, J Leukoc Biol 1996; JB 1997; J Immunol 1998; J Exp Med 1999; Immunology 1999; Eur J Immunol 2000

Broad immune inhibitory activity

Up-regulated in tumor tissues

Galectin-1 (Gal-1) expression: an indicator of poor survival in human cancer

COLORECTAL

(TCGA Database)

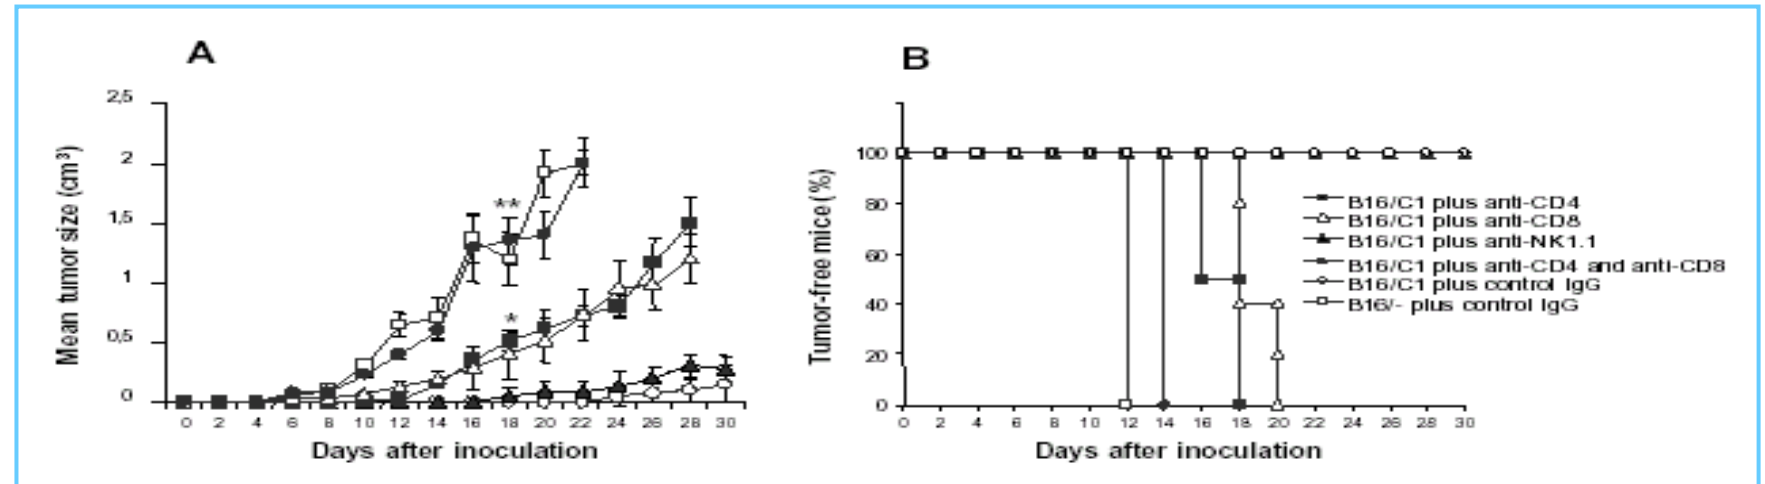

Tumors elude antitumor immunity by secreting Gal-1

- Expression of Gal-1 in human melanoma correlates with poor prognosis and acquisition of metastatic phenotype

- Gal-1 contributes to the immunosuppressive activity of melanoma cells
- Blockade of Gal-1 leads to CD4⁺ and CD8⁺ T cell-mediated tumor rejection that was highly dependent on IFN- γ

Gal-1 activates immune evasive programs in several tumor types

How does Gal-1 shape the tumor-immune microenvironment?

Gal-1 selectively kills effector T lymphocytes

Gal-1 kills effector T cells through binding to specific sugars on their surface

Gal-1 cannot bind and kill anti-inflammatory Th2 and regulatory T cells

Bad for cancer ! Good for autoimmune diseases

Toscano et al, Nature Immunol 2007

Gal-1 induces tolerogenic dendritic cells and shut-off antitumor T cell responses

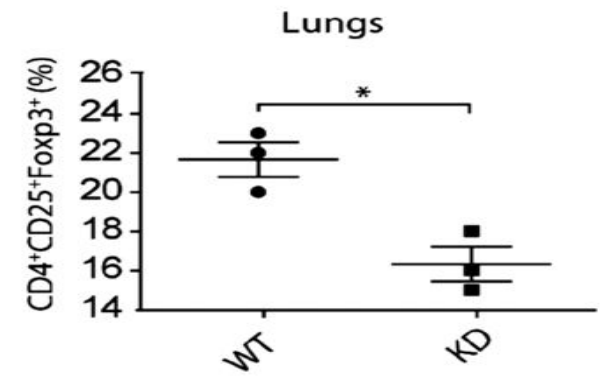

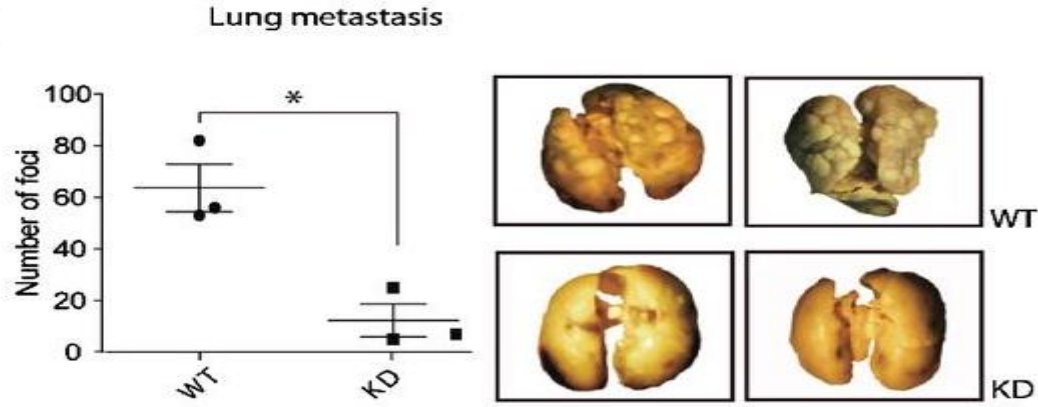

Immunoregulatory circuit

	Therapeutic strategy
Autoimmunity Favours resolution and remission	+ Activation
Infection Impairs resolution	- Blockade
Cancer Promotes tumor-immune escape and metastasis	- Blockade

Ilarregui et al, Nature Immunol 2009, Tesone et al, Cell Rep 2016

Gal-1 favors metastasis by inducing immunosuppressive regulatory T cells

Dalotto Moreno et al, Cancer Res 2013

Gal-1 promotes the formation of aberrant tumor-vascular networks

VEGF-like signaling

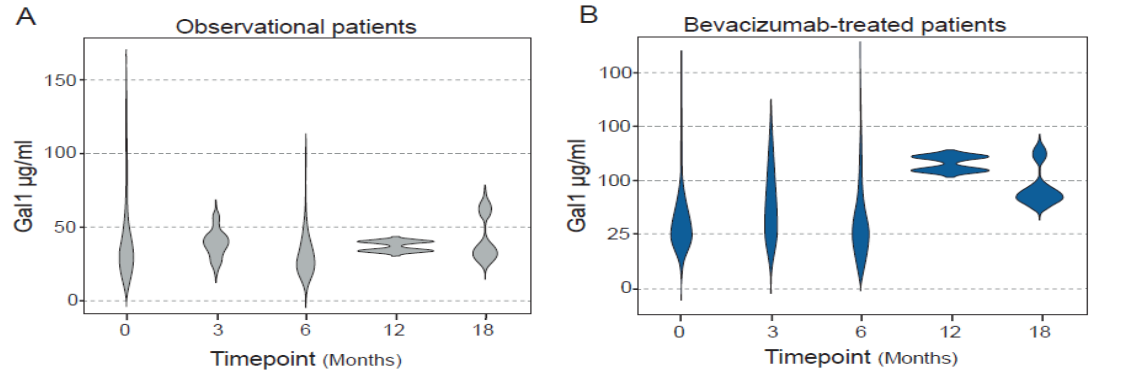

Croci et al, Cell 2014; Croci et al, JEM 2012

Gal-1 confers resistance to anti-angiogenic therapies

Croci et al, Cell 2014; Croci et al, J Exp Med 2012

Circulating Gal-1 levels delineate resistance to anti-angiogenic therapies

- Gal1 is elevated in plasma from bevacizumab-treated patients participating in AVAST-M: a phase 3 clinical trial of adjuvant bevacizumab versus standard surveillance.

- Increasing Gal1 levels over time in patients on the bevacizumab arm, but not on the observation arm, significantly increased risks of recurrence and death.

- Plasma from bevacizumab-treated non-responding patients can reprogram endothelial cell biology through a Gal1 pathway.

N=189

Bannoud et al, Proc Natl Acad Sci USA 2023

Targeting Gal-1 inhibits progression of pancreatic adenocarcinoma by modulating tumor stroma-immune cross-talk

- Lowest survival rates
- Poorest prognosis
- Resistant to immunotherapy

Gal-1 fosters an immunosuppressive microenvironment

in colorectal cancer

- Expression of Gal-1 was independent of microsatellite Instability (MSI) or mismatch repair deficiency (dMMR)
- Gal-1 confers immune privilege to colorectal cancer by increasing the frequency of immunosuppressive CD8 T cells.

Colorectal

Cagnoni et al, Proc Natl Acad Sci USA 2021

Gal1 as an emerging immunotherapeutic target

GAL-1 blockade

- Stimulates antitumor immune responses
- Mitigates abnormal tumor angiogenesis

Anti-inflammatory
Program**

SUPER-GAL1 variant

Immune checkpoint
 → Suppresses autoimmunity
 → Inhibits inflammation-induced neurodegeneration
 → Controls allergic airway inflammation

The future of health is sweet

MISSION: Translate scientific discoveries, based on modulation of galectins and its glycosylated ligands, into novel technologies and therapeutic opportunities for patients with cancer and autoimmune inflammatory diseases

Galectin-1-based Technology Platforms

Platform 1: IMMUNO-ONCOLOGY (Human anti-Gal1 neutralizing mAbs)

- Stimulate antitumor immune responses
- Counteract aberrant tumor angiogenesis

**TWO IN ONE
THERAPY**

Platform 2: AUTOIMMUNITY AND CHRONIC INFLAMMATION (Super-Gal1)

Immunoregulatory Gal1 variants engineered to overcome the adverse conditions of inflammatory microenvironments.

These Super-Gal1 variants target different cells implicated in autoimmune inflammation (Th1, Th17, CD8, dendritic cells, microglia)
